

yum install ntfs-3g

<http://www.ntfs-3g.org/>

Installation

Make sure that the basic Linux development tools and the full [FUSE](#) package is already installed correctly on the computer. Please note, FUSE 2.6.0 or later is required to guarantee full data safety. Then type:

```
./configure
make
make install      # or 'sudo make install' if you aren't root
```

Usage

If there was no error during installation then the NTFS volume can be mounted in read-write mode for everybody as follows. Unmount the volume if it had already been mounted, replace /dev/hda1 and /mnt/windows, if needed.

```
mount -t ntfs-3g /dev/hda1 /mnt/windows
```

You may also need to set the 'locale' option to make all file names with national characters visible. Replace the below hu_HU.utf8 with the [appropriate setting](#).

```
mount -t ntfs-3g /dev/hda1 /mnt/windows -o locale=hu_HU.utf8
```

Please see the ntfs-3g manual page for more options and examples. You can also make NTFS to be mounted during boot by adding the following line to the **end of the /etc/fstab** file:

```
/dev/hda1 /mnt/windows ntfs-3g defaults 0 0
```
